DATASET : Effects of organization and disorganization on pleasantness, calmness, and the frontal negativity in the event-related potential

Sandra Langeslag, University of Missouri-St. Louis

Abstract
This study tested how organization, slight disorganization, and total disorganization affect valence, arousal, and the frontal negativity in the event-related potential. This data set contains the raw EEG files, demographic information, scores on the handedness questionnaire, scores on the orderliness scale of the International Personality Item Pool (IPIP), scores on the organization scale of the Behavioral Indicators of Conscientiousness (BIC), valence and arousal ratings of the stimuli, and organization ratings of the stimuli by research assistants.
